

## Indoor pets are safe from heartworm infection.

Grounded or  **Unfounded?**

**FACT: Mosquitoes—the vectors for heartworm infection—live both outside and indoors,** which exposes any pet to risk of heartworm infection regardless of lifestyle. The potential for heartworm infection in a pet that spends all or most of its life outdoors is obvious. Less obvious is the risk for an indoor pet, which typically goes

outside to the bathroom and may enjoy some outdoor playtime or go for walks. Mosquitoes also find ways to enter homes and frequently stay there for months.

**BEST STRATEGY: Every pet—whether indoor or outdoor—should receive heartworm preventive 12 months a year.**

**Protection is priceless.**

Choose year-round heartworm prevention for your pet.
